### Product Description

Firestarter CLASSIC – Quite big, handy flint with total length 100 mm and flint diameter 8mm (total weight with the striker just 45g)

Convenient plastic handle makes the grip steady so you can skilfully light a fire.

The magnesium part of the firestarter is big enough so there is no worry that will break when it's in use (however it's possible of course) sparking 1,650 °C sparks

Smart multi function striker is has bottle opener, 50 mm ruler and the map scale 1:1 000 000

To ignite a fire just strongly rub the flint with the sharp part of the striker. If the weather conditions are bad (windy, wet, snowy etc.) it's good to carefully scratch a bit of flint shavings on the fireplace and then strike a spark on it. Scratched shavings will burn and give about 1,650 °C what helps to ignite final kindling.

The firestarter will last for around 12000 sparks.
